

UI, UX & Conversion Review

A page-by-page assessment of the Criation storefront — visual design, animation, interaction, accessibility and the psychology of whether a visitor stays, trusts the shop, and buys. Thirty-eight findings, plus what to build next.

5 BLOCKERS	14 HIGH	14 MEDIUM	5 POLISH
---------------	------------	--------------	-------------

VISUAL CRAFT Strong	CONVERSION PATH Broken on desktop	ACCESSIBILITY Not started
MOBILE EXPERIENCE Half-wired	PERFORMANCE BUDGET Over — always-on WebGL	ANALYTICS None installed

THE SHORT VERSION

Someone with real visual taste built this. The card design, spacing rhythm, badge system, free-shipping meter, artisan storytelling and dark mode are all better than most Indian D2C storefronts of this size. A visitor's first three seconds will land well.

What lets it down is that several of the mechanisms a shopper needs are not connected. **There is no cart button in the desktop header at all** — the code computes the item count and then never renders it. The entire mobile navigation drawer is unreachable because nothing ever opens it. Category links do not change the filter once you are on the catalogue page. A WebGL ocean shader runs on the GPU continuously on every page. And every piece of text is 10–12px.

None of this is hard to fix. Most of it is one component each. The gap between where this is and a storefront that converts well is perhaps three focused weeks — but it will not convert until the cart is reachable and the fake urgency is removed.

What is genuinely working

Worth stating plainly before the problems, because these are the parts to protect while fixing everything else.

VISUAL AND STRUCTURAL STRENGTHS

ELEMENT	WHY IT WORKS
Product card	Well-composed hierarchy: image, badge stack, category, rating pill, title, artisan credit, price with strike-through, and a compact add button. The <code>group-hover:scale-108</code> image zoom on a 500ms ease-out is restrained and feels premium.
Free-shipping meter	Present in both the drawer and the cart page, with a live percentage and a colour flip to emerald at 100%. This is one of the highest-ROI conversion mechanics in e-commerce and it is implemented correctly.
Dark mode	Implemented across nearly every component with a pre-paint inline script in <code>layout.tsx</code> that prevents the white flash. Most teams get this wrong.
Theme toggle	The day/night switch with sun, clouds, stars, moon craters and an orbiting orb is a genuine moment of delight, done in pure CSS transitions rather than JavaScript.
Artisan storytelling	Named artisans and locations on the card, the "Weaving Hope, One Stitch at a Time" section, and the 250-craftswomen framing give the brand a reason to exist beyond price. This is the strongest commercial asset in the whole build.
Bundle & related	The product page has both "frequently bought together" with a 15% bundle price and a related-products rail — real basket-size mechanics.
Buy Now	A direct-to-checkout path alongside add-to-cart. Correct for a low-consideration gifting purchase.
Toast system	Four semantic types with correct icons, dismissible, stacked, positioned clear of the mobile bottom bar.
Empty states	Cart, drawer and search all have designed empty states with an icon, an explanation and a route out. Frequently skipped; not skipped here.
Password fields	Show/hide toggles with correct <code>aria-label</code> , and submit buttons that disable during the request.

HOW ATTRACTIVE IS IT, HONESTLY?

On first paint, at desktop width, in light mode: **genuinely appealing** — the hero gradient, the glow spheres, the collage card with the floating product tile and the amber CTA all read as a considered brand. A visitor will not bounce for aesthetic reasons.

The drop-off comes about fifteen seconds later, when they try to *do* something. They look top-right for a cart and there is none. They click a category and the grid does not change. They read a countdown that says the sale ends tonight, refresh, and see the same number again. Each of these is small; together they move the shop from "boutique" to "not quite finished", and that impression is what suppresses the purchase.

Blockers — these stop people buying

Five defects that break the path from browsing to payment. Fix these before any visual work.

UX-1 There is no cart button in the desktop header

components/layout/Navbar.tsx:44, 96 — `setIsMiniCartOpen` and `totalCartCount` are both computed and then never rendered

The header's right-hand cluster contains exactly three controls: the theme toggle, the notification bell, and the profile avatar. No cart icon, no item count, no wishlist. The mobile bottom bar has a cart button but it is `lg:hidden`, so on any desktop screen a shopper who adds an item sees a toast and then has no visible way back to their bag. The only routes are the hover-expand sidebar rail or typing `/cart`.

ESLint has been reporting this the whole time — *"totalCartCount' is assigned a value but never used"* — but the 234 lint errors mean nobody is reading the output.

FIX

Add a cart button with a live item-count badge to the header cluster, opening the existing `MiniCartDrawer`. Add wishlist beside it. Both pieces of state already exist; this is a ten-line change and it is the single highest-value fix in this document.

UX-2 The mobile navigation drawer can never open

components/layout/Navbar.tsx:65, 475–575

Roughly a hundred lines of mobile navigation — search, sign in / register, Shop All, Flash Deals, Dropship Hub, VIP Prime, Seller Portal, My Account, and the full category list with item counts — sit behind `{isMobileMenuOpen && (...)}`. Every reference to `setIsMobileMenuOpen` in the file passes `false`. Nothing ever passes `true`. The hamburger button instead dispatches a `criation:toggle_sidebar` window event that opens the sidebar component, so this drawer is dead markup.

FIX

Decide which one is the mobile navigation — the sidebar or this drawer — then delete the loser. If you keep the drawer, wire the hamburger to it. Shipping two competing navigation systems, one of them unreachable, is how the category list ends up invisible on phones.

UX-3 Category links stop working once you are on the catalogue page

app/products/page.tsx:23–29

```
const initialCategory = searchParams.get("category") || "all";
...
const [selectedCategory, setSelectedCategory] = useState<string>(initialCategory);
```

The URL parameter is read once, into the initial value of a `useState`. Next.js reuses the component across client-side navigations, so going from `/products?category=diyas` to `/products?category=crochet` — which is what every category tile, sidebar link and footer link does — changes the URL and leaves the grid showing the previous category. To the shopper, the site simply ignores their click.

FIX

Drive the filters from `searchParams` directly rather than copying them into state, and write filter changes back to the URL with `router.replace`. That also makes filtered views shareable and bookmarkable, which they currently are not.

UX-4

The wrong variant and image carry across between products

app/products/[id]/page.tsx:49-51

```
const [selectedImageIdx, setSelectedImageIdx] = useState(0);
const [selectedVariant, setSelectedVariant] = useState<ProductVariant | undefined>(
  product?.variants[0]
);
```

Same root cause. Navigate from one product to another through the related-products rail and the component is reused: the variant selection, the price derived from it (`currentPrice = selectedVariant.price`), the gallery position and the quantity all persist from the previous product. The shopper can be shown a price that belongs to a different item and add it to the cart at that price.

FIX

Key the page on the product ID, or reset the four pieces of state when `product.id` changes. Given the pricing implication, treat this as correctness, not polish.

UX-5

No autofill anywhere — zero autoComplete attributes in the codebase

whole app — `grep -rn "autoComplete"` returns nothing across 41 components

Login, registration, the checkout address form and the support form carry no `autoComplete` hints, so browsers and password managers cannot fill them. There is also no `inputMode` anywhere and no `type="tel"`, so the six-digit PIN code field and the phone field open a full QWERTY keyboard on mobile instead of a number pad.

Address entry is consistently the highest-abandonment step in mobile checkout. Turning on autofill is a handful of attributes and is measured, repeatedly across the industry, as one of the largest single conversion wins available.

FIX

Add `autocomplete="email"`, `"current-password"`, `"new-password"`, `"name"`, `"tel"`, `"street-address"`, `"address-level2"`, `"postal-code"`, and `inputMode="numeric"` on the PIN code. Half a day of work.

Performance & animation

How the site feels in the hand — and what it costs the phone holding it.

UX-6 A raymarched WebGL ocean runs continuously on every page

components/layout/NavbarOceanCanvas.tsx — 400 lines, mounted inside the sticky header

The navbar background is a live WebGL fragment shader: a raymarched sea with 7 trace steps and 4–5 octaves of fractal noise evaluated per pixel, driven by an unconditional `requestAnimationFrame` loop. It renders across the full page width at up to 1.25× device pixel ratio, on every route, for as long as the tab is open.

```
const render = (now: number) => {  
  drawFrame(now);  
  animId = requestAnimationFrame(render); // never conditional, never paused  
};
```

There is no `visibilitychange` handler, so it keeps rendering in a background tab. There is no `prefers-reduced-motion` check. There is no low-end device fallback. On a mid-range Android this competes with scrolling, warms the device and drains battery — while a shopper is trying to look at photographs of handmade goods. It is the most expensive thing on the site and it is decorative.

FIX

Pause on `document.hidden`, skip entirely under `prefers-reduced-motion`, cap the frame rate to ~30fps, and fall back to the CSS gradient that already sits behind it on any device reporting limited hardware. Better still: render one frame to a static image and use that. The gradient underneath already looks good.

UX-7 Every product image loads eagerly — lazy loading is disabled

components/products/ProductCard.tsx:32 · app/page.tsx hero

```
<Image src={...} alt={product.name} fill  
  loading="eager" // on every card, not just above the fold  
  priority={priority}  
  className="object-cover group-hover:scale-108 ..." />
```

`loading="eager"` is set on the shared card component, so every product image on the catalogue page — the full grid, not the visible rows — downloads immediately. On a catalogue of any size this is the dominant cost of the page and it lands squarely on mobile data. The `priority` prop is already threaded through for the genuinely above-the-fold cards, which is the correct mechanism; the blanket `eager` defeats it.

FIX

Remove `loading="eager"` from the card and let `priority` handle the first four. Also remove the invalid `preload={true}` prop from the hero image in `app/page.tsx` — `priority` is the supported prop.

UX-8

32 infinite animations, and no reduced-motion support anywhere

globals.css and 11 components – `grep -rn "prefers-reduced-motion"` returns nothing

`animate-float`, `animate-spin-slow`, `animate-pulse-glow`, `animate-shimmer`, `animate-pulse` and `animate-ping` appear 32 times across the login page, register page, loading screen, order detail, product detail, subscription page, AI widget, sidebar, spinner and theme toggle. Several run simultaneously on the same screen.

Continuous motion is a documented trigger for people with vestibular disorders, and the operating-system setting that exists to protect them is respected nowhere in this codebase. It is also a constant repaint cost stacked on top of UX-6.

FIX

Add a global `@media (prefers-reduced-motion: reduce)` block in `globals.css` that neutralises animation and transition durations, and cut the simultaneous-animation count on the auth and loading screens to one focal element.

UX-9

Only one loading state exists for the entire application

`app/loading.tsx` is the only route-level loading file; no `error.tsx` or `not-found.tsx`

Every route transition falls back to the same full-screen "Handcrafting your experience..." splash with rotating copy. A splash screen is the right answer for a cold start and the wrong answer for moving from the catalogue to a product — there, a skeleton that matches the destination layout keeps perceived speed high. Any thrown error, meanwhile, shows the raw Next.js error page.

FIX

Add per-segment `loading.tsx` skeletons that mirror each layout, plus `error.tsx` and `not-found.tsx` in the brand's voice.

Visual design & brand

UX-10

Almost the entire site is set at 10–12px

measured across app/ and components/

SIZE	USES	WHERE
text-xs · 12px	416	Body copy, prices, buttons, labels, descriptions
text-[11px]	85	Artisan credits, helper text
text-[10px]	81	Badges, stock warnings, tabs
text-sm · 14px	89	Occasional headings
text-base · 16px	26	Rare

Six hundred uses at 12px or below against 115 at 14px or above. The comfortable reading baseline for body text on the web is 16px; 12px is a caption size. The effect is a site that looks dense and technical rather than considered and premium — and for devotional and festive goods, where a meaningful share of buyers are over 45, it is a straightforward barrier to reading the product description at all.

FIX

Rebase the scale: body 16px, secondary 14px, captions and badges 12px, and stop below that. Prices and product titles on cards should be 16–18px. This one change will do more for perceived quality than any new feature.

UX-11

The header's colour has nothing to do with the rest of the brand

components/layout/Navbar.tsx:120

The header is `from-amber-600 via-orange-500 to-amber-700`. Everything below it — buttons, links, focus rings, badges, the hero gradient, the CTA on every card — is indigo and purple. A shopper meets an orange site and then scrolls into a purple one. Amber works well as the accent it already is on price and rating; as the primary header field it fights the brand.

FIX

Pick one primary. Given that indigo dominates the product surface, make the header a deep indigo or a near-neutral, and keep amber as the highlight for price, ratings and the sale badge — which is where it is doing real work.

UX-12

No logo, no wordmark, no typeface of its own

Navbar.tsx (the "C" square is the mobile menu trigger) · globals.css body font

The only brand mark is a gradient square containing the letter C, and on desktop it is hidden because it is `md:hidden` — so the desktop header carries no brand identity at all. Typography is the raw system stack; there is no `next/font` anywhere. A shop whose entire premise is craft and authorship has no visual signature of its own.

FIX

Commission or set a wordmark, place it top-left at all breakpoints linking to home, and choose a typeface pair through `next/font` — a warm humanist serif for headings against a clean sans for interface would suit handcrafted goods far better than the system default.

UX-13**The header is 80–104px tall and carries no navigation**

Navbar.tsx:123 — `h-20 sm:h-24 lg:h-26`

A very tall sticky header, consuming that height on every scroll position, holding a search box and three icons. There are no category links, no "Shop", no "New in", no "Gifts". All navigation is hidden behind a 72px icon rail that expands on hover. On a 667px-tall phone viewport, the header plus hero badge means the first product is well below the fold.

FIX

Reduce to 56–64px, put the wordmark left and 4–6 top-level category links across the middle, and keep search prominent. Let the sidebar be a secondary index rather than the only way to reach a category.

UX-14**Primary navigation depends on hover, with no keyboard path**

components/layout/AppSidebar.tsx:59–71

The sidebar expands on `isHovered` or when pinned. Hover-triggered navigation opens accidentally when the cursor crosses the left edge, is unavailable on touch, and cannot be reached by keyboard at all. The "Home" link also calls `window.location.reload()` and `window.location.href`, forcing a full document reload and discarding the cart drawer state and scroll position — Next.js flags this as an error.

FIX

Make expansion click/focus-driven rather than hover-driven, ensure it is reachable in the tab order, and replace the location assignments with `<Link href="/">`.

UX-15**The mobile bottom bar has six items and an undefined safe-area class**

components/layout/MobileBottomBar.tsx:30

Six destinations — Home, Shop, Dropship, Wishlist, Cart, Account — with 10px labels. Five is the practical maximum before targets fall below the 44px minimum. "Dropship" is a merchant-facing destination occupying a slot in a consumer navigation bar. The container also carries the class `safe-area-pb`, which is not defined anywhere in the project, so on notched iPhones the bar sits under the home indicator.

FIX

Drop to five by moving Dropship into the account area, define the safe-area padding with `env(safe-area-inset-bottom)`, and raise labels to 11–12px.

Accessibility

Beyond the legal and ethical case: assistive-technology users buy things, and most of these fixes also improve the experience for everyone else.

UX-16 No modal or dialog semantics exist anywhere in the application

MiniCartDrawer · NotificationCenter · AIChatWidget · review modal · admin gate

A search across the whole codebase for `role="dialog"`, `aria-modal`, focus trapping, or an `Escape` key handler returns nothing. Consequently every overlay in the app:

- does not announce itself to a screen reader;
- does not trap focus, so tabbing walks into the page behind it;
- cannot be closed with the Escape key;
- does not lock body scroll, so the page scrolls underneath the cart drawer;
- does not return focus to the button that opened it.

FIX

Build one `<Dialog>` primitive — or adopt Radix, which is unstyled and works with your Tailwind classes — and route all five overlays through it. Single component, fixes the whole class of problem.

UX-17 Toasts are never announced — "Added to cart" is silent to screen readers

components/ui/Toast.tsx

The toast container has no `role="status"` and no `aria-live` region. Since toasts are the *only* confirmation that adding to cart worked — the button itself does not change state — a screen-reader user gets no feedback that anything happened at all.

FIX

Add `role="status" aria-live="polite"` to the container (and `assertive` for errors). Separately, give the add-to-cart button its own brief success state, which helps sighted users too.

UX-18 Interactive elements built as divs, and focus styling removed

app/checkout/page.tsx:440 (payment tiles) · several filter and option controls

The payment-method selector is a set of `<div onClick>` elements. They cannot be reached by keyboard, are not announced as radio options, and have no selected state exposed to assistive technology — at the payment step. Elsewhere `focus:outline-hidden` is applied; where it is paired with a `focus:ring` that is fine, but on the profile button it removes the indicator with nothing in its place.

FIX

Payment methods become a `fieldset` of real radio inputs. Audit every `focus:outline-hidden` for a replacement ring, and add a global visible focus style plus a skip-to-content link.

UX-19

Contrast failures in the small grey text

pervasive — `text-zinc-400` and `text-zinc-500` on white at 10–11px

Artisan credits, review counts, "items" counters and helper text use zinc-400 on a near-white ground. At those sizes this sits below the WCAG AA 4.5:1 threshold. Combined with UX-10, the supporting copy that carries the artisan story — the brand's main differentiator — is the hardest text on the page to read.

FIX

Move secondary text to zinc-600 in light mode and zinc-400 in dark, and stop using zinc-400 for anything a customer needs to read.

Dark mode defects

Dark mode is well handled almost everywhere, which makes the three places it was forgotten more jarring.

UX-20 The loading screen is white in dark mode

app/loading.tsx – `bg-white`, `text-zinc-900`, `bg-indigo-50`, `border-zinc-200` with no dark variants

The route-transition splash has no dark-mode classes at all. A dark-mode shopper navigating between pages gets a full-screen white flash on every transition — the exact problem the careful pre-paint script in `layout.tsx` was written to avoid. The same applies to `LoadingSpinner.tsx`, whose ring interior is hardcoded `bg-white`.

FIX

Add the `dark:` variants to both components.

UX-21 Skeleton shimmer and scrollbar are hardcoded light

app/globals.css

```
.animate-shimmer {  
  background: linear-gradient(90deg, #f4f4f5 25%, #e4e4e7 50%, #f4f4f5 75%);  
}  
::-webkit-scrollbar-track { background: #f4f4f5; }  
::-webkit-scrollbar-thumb { background: #d4d4d8; }
```

In dark mode the skeleton placeholders glow near-white against a near-black page, and the scrollbar is a bright white channel down the edge of every screen.

FIX

Define both through CSS custom properties that flip with the `.dark` class, alongside the `--background` and `--foreground` tokens already there.

UX-22 Toasts are always dark, in both themes

components/ui/Toast.tsx

Backgrounds are fixed at `bg-emerald-950/90`, `bg-rose-950/90` and so on. They read fine, but in light mode they are the only dark surface on screen. A deliberate choice would be defensible; here it looks like the dark variants were simply not written.

FIX

Either add light-mode variants, or keep dark toasts as an intentional signature and make sure they carry a consistent shadow treatment.

Trust, persuasion and the fake-urgency problem

This section matters most to the question of whether people buy more. The mechanics here are working against the brand's own story.

UX-23 The flash-sale countdown is fake and visibly resets

app/page.tsx:28-41

```
const [timeLeft, setTimeLeft] = useState({ hours: 14, minutes: 35, seconds: 42 });
...
if (prev.hours > 0) return { hours: prev.hours - 1, minutes: 59, seconds: 59 };
return { hours: 24, minutes: 0, seconds: 0 }; // rolls straight back to 24h
```

Every visitor, on every visit, starts at 14:35:42 — and the banner reads "Ends tonight!". Refresh the page and the clock jumps back. When it reaches zero the sale silently restarts. Shoppers recognise this pattern quickly, and the recognition is expensive: a fake deadline on the homepage teaches people that the delivery date, the stock warning and the review count are probably invented too. For a brand whose pitch is authenticity and named artisans, this is the most self-defeating element on the site.

It is also increasingly a regulatory matter — false urgency and countdown timers that reset are named as dark patterns under India's CCPA guidelines on dark patterns, and equivalent rules in the EU and UK.

FIX

Either run genuine, server-defined sale windows with a real end timestamp and let the banner disappear when it passes, or remove the timer. Real scarcity converts. Fake scarcity converts once, then costs the repeat purchase.

UX-24 The delivery promise is hardcoded and shown before anyone asks

app/products/[id]/page.tsx:52, 86-92

```
const [pincodeStatus, setPincodeStatus] = useState<string | null>(
  "Delivery by Monday, 25 Aug • FREE"); // shown before any check
...
if (pincode.length === 6) {
  setPincodeStatus(`Express Delivery to ${pincode} by Monday, 25 Aug • FREE`);
}
```

Any six digits are accepted — including 000000 — and always return the same date, which is now frozen in the past and will read as an obviously stale promise to every future visitor. A delivery date the shop cannot keep is the fastest route to a refund request and a one-star review.

FIX

Validate against a real serviceability list from your courier, compute the date from dispatch SLA plus zone, and show nothing until the shopper has entered a PIN code.

UX-25**Reviews and support tickets are accepted and discarded**

app/products/[id]/page.tsx:109-115 · app/support/page.tsx:50

```
const handleReviewSubmit = (e) => {  
  e.preventDefault();  
  showToast("Review Submitted ★", "Thank you for supporting our handcrafted artisans!");  
  setIsReviewModalOpen(false);    // nothing is stored, nothing is displayed  
};
```

The review never appears, the rating never moves, the count never changes. The support form promises a reply "within 2 hours" to a ticket that does not exist. Twenty-six handlers across the app follow this shape — a toast standing in for an action.

FIX

Until these are wired to the server (see the Errors & Problems report), hide the review form and route support to a real mailbox. Promising a reply you cannot send is worse than showing an email address.

UX-26**Shoppers are offered a "Superadmin Center" in the profile menu**

components/layout/Navbar.tsx:112-117 · AppSidebar.tsx:121-126

The customer profile dropdown contains a four-way portal switcher: Customer Store, Merchant Hub, Wholesale Supplier and Superadmin Center. A shopper clicking their avatar to check an order sees an administration console offered to them. It reads as a site that is still in development — and it is the visible face of the privilege-escalation defect documented as C-1 in the security report.

FIX

Show only the portals the signed-in account actually holds, resolved server-side. Most shoppers should see none of it.

UX-27**Working discount codes are printed in the coupon field**

components/cart/MiniCartDrawer.tsx placeholder · app/cart/page.tsx:236

The placeholder text reads *"Try CRIATION10, FIRST500..."*. Every visitor is handed a discount they were not going to ask for, on every order, which comes straight out of margin. Coupon fields also have a known side effect: a visible empty coupon box makes shoppers leave to hunt for a code. Roughly a quarter do not come back.

FIX

Empty placeholder, or collapse the field behind a small "Have a code?" link. Target codes at the segments you actually want to discount.

UX-28

Static claims presented as live data

app/page.tsx hero • ProductCard stock warning

"250+ Master Artisans", "4.9★ Customer Rating" and "1-Day Express Dispatch" are hardcoded, and the loading screen says 200+ while the homepage says 250+. The card's ⚡ `Only {stock} left` warning fires below 25 units, which is not scarce, and the number is fixture data. Each is defensible individually; together they establish a pattern the shopper starts to notice.

FIX

Derive these from real data once the server exists, make the numbers agree with each other in the meantime, and set the low-stock threshold to something that is genuinely low.

UX-29

No trust signals where the decision is actually made

product page buy area • checkout

The trust row — secure payment, 7-day returns, authenticity — appears further down the product page, not adjacent to the Add to Cart button where hesitation happens. Checkout claims "256-Bit SSL Encrypted Payment Portal" under a padlock, which is currently untrue and will need rewriting once a real gateway is in place.

FIX

Put three short, true reassurances directly beneath the buy button: returns window, dispatch time, and the payment methods you accept as recognisable logos.

Page by page

Quick assessment of all 20 customer-facing routes.

PAGE	VERDICT	NOTES
Home	Strong	Good hero, category grid, artisan story. Undermined by the fake countdown. Needs testimonials and a newsletter capture.
Products	Broken	Rich filter set — price, rating, stock, tags, sort — but the URL bug (UX-3) breaks category entry. No pagination or infinite scroll; no results-count feedback on filter change.
Product detail	Mixed	Best-built page: gallery, variants, bundle, related, tabs, pincode. Held back by UX-4, no zoom, fake delivery date, non-functional reviews, no sticky mobile buy bar.
Cart	Good	Free-shipping meter, save-for-later, coupon, clear summary. Give away fewer codes.
Checkout	Weak	Three clean steps, but div-based payment tiles, no autofill, no address validation, a decorative card form, and no order-summary edit path.
Orders / detail	Good	Tracking timeline is well designed. Data is local-only, so it disappears when browser storage is cleared.
Account	Adequate	Profile, wallet, addresses. Wallet top-up takes no payment. No tier-progress visualisation despite a tier system existing.
Wishlist	Adequate	Works. No move-all-to-cart, no price-drop alerts, no sharing.
Search	Thin	Correctly wrapped in Suspense. No facets, no "did you mean", no zero-result recovery beyond a message.
Deals	Thin	Little beyond a filtered grid. Should be the second-most-visited page on a festive storefront.
Auth (login / register)	Good	Clean, show/hide password, disabled submit states. Missing autofill, password strength, social sign-in and any forgot-password link.
Legal	Risk	Well laid out, but the content asserts compliance the platform does not have.
Support	Misleading	Form discards input while promising a 2-hour reply.
Subscription	Elaborate	710 lines of plan comparison and billing UI with no billing behind it. Highest effort-to-value ratio on the site right now.
AI tools / chat	Misleading	Keyword branching presented as an AI concierge. Will fail on the first unanticipated question.
Dropship / Seller / Supplier / Admin / Affiliate	Out of place	Nearly 2,000 lines of merchant tooling sharing navigation with the consumer storefront. These belong behind authentication in the separate admin app that already exists in this monorepo.

What to add — ranked by likely effect on sales

Assuming the blockers above are already fixed. Highest expected return first.

TIER 1 — DO THESE FIRST

ADDITION	WHY IT EARNS ITS PLACE HERE
Analytics, at all	There is no GA4, no Meta pixel, no PostHog, no event tracking of any kind. You currently cannot tell which products are viewed, where checkout is abandoned, or whether any change you make helps. Everything below is guesswork until this exists.
Real reviews with photos	User photographs of handmade goods are the single most persuasive asset a craft store has, because the honest variation between pieces is the product. Add verified-purchase badges and a rating distribution.
Image zoom and more photography	Texture is the purchase decision for crochet, clay and fabric. Pinch-zoom on mobile, hover-zoom on desktop, plus a scale reference and one in-use shot per product.
Gift mode	Diyas, poshaks, thalposh and keychains are overwhelmingly bought as gifts. Gift wrap, a message card, hide-the-price, and direct-to-recipient shipping. Rare among Indian craft sellers and a genuine differentiator.
Sticky mobile buy bar	Price and Add to Cart pinned to the bottom of the product page on mobile, so the decision is always one tap away no matter how far the shopper has scrolled.
Cart recovery	Save the cart to the account, then email a reminder. Meaningless while the cart lives only in localStorage, which is why the server work in the other report gates this.

TIER 2 — BUILD AFTER THE FIRST TIER IS MEASURED

ADDITION	NOTES
Occasion landing pages	Diwali, Janmashtami, Karwa Chauth, weddings, Raksha Bandhan. These are how people actually search for this merchandise, and they are the SEO surface the site is missing.
Artisan profile pages	A page per craftswoman with her story, location and pieces. Turns the social mission from a banner into something browsable, and gives each product a second entry point.
Recently viewed & quick view	Standard catalogue retention mechanics; both are straightforward with the state layer already in place.
Back-in-stock alerts	Handmade stock is genuinely limited, so this captures demand that is currently lost silently.
Bundles and curated sets	"Complete your Diwali table" — the bundle mechanic already exists on the product page; make it a merchandised collection.
Loyalty progress	Tiers and points already exist in the data model with no interface. Show progress to the next tier; it reliably lifts repeat rate.
Size, care and materials	Dimensions with a real-world reference, wash and care guidance, materials list. Reduces returns and answers the question that stops the purchase.

ADDITION	NOTES
Newsletter / WhatsApp opt-in	WhatsApp is the highest-engagement channel in this market. Capture on the homepage and after purchase.

TIER 3 – WORTHWHILE LATER

- **PWA and push notifications** — installability plus re-engagement on Android, which is the majority of this audience.
- **Video on product pages** — a fifteen-second clip of the piece being made carries the craft story better than any copy.
- **Referral programme** — the affiliate page exists but is disconnected from any customer-facing mechanism.
- **Multi-language** — Hindi at minimum, given the devotional catalogue.
- **Live chat with a human handoff** — replacing, rather than sitting beside, the keyword bot.
- **Comparison view** — useful once the catalogue is deep enough for it to matter.

Suggested order of work

WEEK 1

Make the shop usable

All five blockers

- **Cart button in the header** with an item count, opening the existing drawer. Add wishlist beside it.
- **Resolve the two navigations** — wire the mobile drawer or delete it.
- **Drive catalogue filters from the URL**, and write changes back to it.
- **Reset product state on navigation** so variants and prices cannot cross over.
- **Add autofill and input modes** to every form.
- **Install analytics** before changing anything else, so the rest can be measured.

WEEK 2

Earn trust and fix the feel

Honesty, performance, typography

- **Remove or make real** the countdown, the delivery promise and the stock warnings.
- **Hide what does not work** — the review form and the support form — until they are wired.
- **Rebase typography** to a 16px body scale.
- **Tame the ocean shader**: pause when hidden, respect reduced motion, or replace with a still.
- **Restore lazy loading** on product images.
- **Add the reduced-motion block** and fix the light-mode-only loading screens.

WEEK 3

Accessibility and brand

Dialog primitive, header, identity

- **One dialog primitive** with focus trap, Escape and scroll lock; route all five overlays through it.
- **Live regions on toasts** and real radio inputs for payment methods.
- **Rebuild the header**: shorter, wordmark left, category links visible, one primary colour.
- **Raise secondary text contrast** and add a visible global focus style.
- **Move merchant tooling** out of the consumer navigation.

WEEK 4+

Build what makes people buy more

Tier 1 additions

- Photo reviews, image zoom, richer product photography.
- Gift mode — wrap, message, hidden price, direct shipping.
- Sticky mobile buy bar and post-purchase cross-sell.
- Occasion landing pages and artisan profiles.
- Cart recovery, once orders live on the server.

ONE THING TO KEEP IN MIND

The instinct when a site is not converting is to add persuasion — more urgency, more badges, more popups. This build has already gone some way down that road, and it is the part working against you. The strongest asset here is true and is being under-used: real women, named, in named places, making things by hand that no factory makes twice. Photograph that, write it properly, put it next to the product, and let the countdown go.
